## 1.0 INTRODUCTION

This indoor air quality report has been prepared by Aurora Industrial Hygiene (Aurora) for the exclusive use of DPR Construction and the San Diego State University (SDSU). Our work is intended to assist you. This report does not necessarily include every possible loss potential, code violation or exception to good practice. This report applies only to the sample, or samples, investigated and is not necessarily indicative of the quality or condition of apparently identical or similar products or conditions. As a mutual protection to SDSU, the client, the public, and Aurora this report is submitted and accepted for the exclusive use of the client to whom it is addressed and upon the condition that it is not to be used, in whole or in part, in any advertising or publicity matter without prior written authorization from Aurora.

This report summarizes specific results and findings from sampling conducted in the Professional Studies and Fine Arts (PSFA) building at the SDSU in San Diego, California. Air monitoring was conducted from April 24-26, 2019. The sampling was conducted by Industrial Hygienists Rick Shockley and Robert Rinck, under the immediate supervision of Certified Industrial Hygienist Karen Shockley. The specific sampling protocol was coordinated with DPR/SDSU and included the following: air sampling for bioaerosols, fiberglass, asphalt fumes, coat tar pitch volatiles (CTPV), Stoddard solvent, polynuclear aromatic hydrocarbons (PNAHs), organic vapors, aldehydes, and direct reading measurements for temperature (T), humidity (RH), carbon monoxide (CO), carbon dioxide (CO<sub>2</sub>), particulates, and volatile organic compounds (VOCs). Additionally, a visual assessment of the condition of installed asbestos-containing materials was conducted.

## 2.0 EXECUTIVE SUMMARY

At the request of San Diego State University (SDSU), Aurora Industrial Hygiene conducted air sampling and a visual assessment in the Professional Studies and Fine Arts (PSFA) building. The monitoring was conducted from April 24-26, 2019. Four sampling locations were selected on each of the four floors of the building in order to represent every HVAC zone. The specific sampling protocol included:

- Air sampling for bioaerosols (i.e. mold);
- Air sampling for fiberglass;
- Air sampling for constituents of materials that were recently installed on the building's, roof, including asphalt, coal tar pitch volatiles (CTPV), Stoddard solvent, and polynuclear aromatic hydrocarbon compounds (PNAHs);
- Air sampling for constituents of widely used ingredients in household products, including a list of 25 organic vapor compounds;
- Air sampling for materials that could potentially off-gas following installation of new carpeting, furnishings, and cabinetry, including a list of ten aldehyde compounds;
- Direct reading measurements for temperature (T), humidity (RH), carbon monoxide (CO), carbon dioxide (CO<sub>2</sub>), particulates, and volatile organic compounds (VOCs); and
- A visual assessment of the condition of installed asbestos-containing materials.

Follow-up sampling for formaldehyde was conducted on May 9, 2019. Follow-up sampling for total mold spores was conducted on May 15, 2019.

The federal government and the State of California have defined Permissible Exposure Limits (PEL) for chemical exposures in the workplace. These limits refer to “airborne contaminants to which nearly all workers may be exposed daily during a 40-hour workweek for a working lifetime without adverse effect. Because of some variation in individual susceptibility, an occasional worker may suffer discomfort, aggravation of a pre-existing condition, or occupational diseases upon exposures even below the values specified. The exposure limits established by this section reflect current medical opinion and industrial hygiene practice, doubts being resolved on the side of safety, and are intended to be used in accordance with good industrial hygiene practice by qualified persons.” PELs are typically measured as 8-hour time-weighted averages, although in some cases short term (15 minute) and instantaneous limits apply as well. An employer may not expose employees to concentrations above PELs, unless additional protective measures are in place to educate employees and reduce exposure. Other organizations, such as the National Institute for Occupational Safety and Health (NIOSH) publish Recommended Exposure Limits (RELs). RELs are recommendations and are not legally enforceable occupational standards.

**All air sampling results were below the established OSHA PELs at all locations.**

Findings were as follows:

- Mold: 39 indoor and six outdoor air samples were collected during the initial assessment. All of the indoor air samples had less mold detected than the outdoor air samples. 38 of the 39 indoor air samples had similar distribution of mold types as the outdoor air samples. One indoor air sample, which was collected in an unoccupied utility closet, indicated a possible indoor mold

source in the closet. Further investigation in this location was recommended. Follow-up sampling was conducted and results were less than outdoors and did not indicate an indoor mold source.

- Fiberglass, asphalt, coal tar pitch volatiles, Stoddard solvent, and organic vapors were not detected in any of the indoor air samples at any of the locations.
- Most PNAH compounds were not detected. The compounds that were detected were at levels well below the OSHA PEL and NIOSH REL.
- The majority of aldehyde compounds were not detected at any of the locations. Only formaldehyde was detected at one location at levels well below the OSHA PEL but slightly in excess of the NIOSH REL. Recommendations to increase ventilation and conduct further assessment were made. Follow-up sampling for formaldehyde was conducted in all the rooms in the vicinity of the formaldehyde detection. Formaldehyde was detected in one of the 13 indoor air follow-up samples. Results were below the initial result, well below the OSHA PEL, and slightly in excess of the NIOSH REL. Follow-up sampling is recommended.
- Carbon monoxide and carbon dioxide were below any levels of concern at all locations.
- Temperature measurements were generally within typical comfort ranges but were at times hotter and colder than is typically considered comfortable.
- All installed asbestos-containing materials were observed to be in good/intact condition.

Laboratory reports and logged data from the direct reading instruments are included in Appendices B and C.

## 3.0 FINDINGS

Industrial Hygienists Rick Shockley and Robert Rinck, along with Karen Shockley, CIH, of Aurora, conducted the sampling, which included direct reading measurements of temperature (T), relative humidity (RH), carbon monoxide (CO), carbon dioxide (CO<sub>2</sub>), particulates, and volatile organic compounds (VOCs) using SmartSense air quality monitors, and air sampling for fiberglass, asphalt fumes, coat tar pitch volatiles, Stoddard solvent, polynuclear aromatic hydrocarbons (PNAHs), organic vapors, aldehydes, and bioaerosols in various locations. This assessment and sampling were conducted in order to evaluate the indoor air quality of the PSFA building.

### 3.1 Visual Assessment of Asbestos-Containing Materials

The hazardous materials inspection for the building was provided to Aurora by San Diego State University. Aurora reviewed the inspection to learn the location of installed asbestos-containing materials within the building. A State of California Certified Asbestos Consultant conducted a walk-through of the building to visually assess the condition of asbestos-containing materials. The materials appeared in good condition and intact.

### 3.2 Direct Reading Monitoring

Direct reading monitoring stations were set up at four locations on each of the four floors for T, RH, CO, CO<sub>2</sub>, particulates, and VOCs using SmartSense monitors, which were all properly calibrated prior to use. The SmartSense monitors were placed at each location for approximately 8 to 24 hours before being moved to the next location. Data was collected continuously and recorded every minute as 15-minute rolling averages. A summary of the measurements is provided in Section 3.2.7. A brief description of the results is as follows:

#### 3.2.1 Temperature

In ASHRAE Standard 55-2013, “Thermal Environmental Conditions for Human Occupancy”, the recommended temperature range is 68°F to 82°F depending on relative humidity, season, clothing worn, activity levels, and other factors. OSHA recommends temperature control in the range of 68-76°F.

*Findings:* The average temperatures of most areas were within the ASHRAE recommended comfort range, however there were periods where the temperatures were outside the comfort range (cold and hot).

#### 3.2.2 Humidity

ASHRAE Standard 62.1-2013, “Ventilation for Acceptable Indoor Air Quality,” recommends that relative humidity (RH) in occupied spaces be maintained to less than 65% to minimize drying of mucous membranes and growth of allergenic or pathogenic organisms.

*Findings:* The average humidity measurements were below the recommended maximum at all monitored locations.

### 3.2.3 Carbon Monoxide

CO is a common background contaminant in the outdoor environment due to exhaust emissions from vehicular traffic, cigarette smoke, and other combustion sources. CO can enter building interiors through pathways such as open doorways/windows, inward air leakage (infiltration) through openings in building components, and through the outside supply air (OSA) intakes serving the ventilation system. Title 8 of the California Code of Regulations, Section 5155 (T8 CCR 5155) has established a Permissible Exposure Limit (PEL) for CO of 25 parts per million (ppm) as an acceptable 8-hour time-weighted average for employees. The most current American Society of Heating, Refrigeration, and Air Conditioning Engineers (ASHRAE) indoor air quality standard recommends that indoor carbon monoxide levels not exceed an average of 9 ppm per eight-hour work day and Environmental Protection Agency (EPA) has developed an ambient standard for carbon monoxide of 9 ppm averaged over eight hours.

*Findings: The average measured CO levels ranged from 0 – 1.4 ppm during the sampling period for all monitored locations. All CO levels were well below established exposure levels.*

### 3.2.4 Carbon Dioxide

Human occupants produce CO<sub>2</sub>, water vapor, particulates, biological aerosols, and other contaminants. Measurements of CO<sub>2</sub> levels are used as a screening technique to evaluate whether enough outside air is being introduced into the environment to effectively remove these contaminants. CO<sub>2</sub> is used as a surrogate indicator for other contaminants, including some particulates and odors that may build up due to the lack of adequate fresh air supply. The accumulation of CO<sub>2</sub>, together with the physical factors such as air temperature and humidity, can act to produce health symptoms associated with a poorly ventilated indoor environment.

The general rule of thumb is that complaints such as headaches, fatigue, and eye/throat irritation will often occur whenever CO<sub>2</sub> concentrations exceed 1,000 parts per million (ppm) for a substantial period of time. A probable cause of this condition is inadequate ventilation. It is important to note that the CO<sub>2</sub> level itself is not the cause of adverse symptoms but is used as an indicator of adequate fresh air.

In addition, ASHRAE recommends that the level of carbon dioxide (in order to provide adequate fresh air to replace respired oxygen, dissipate odors, moisture, and heat) not exceed 700 ppm above the ambient outdoor concentration which is typically 300-500 ppm.

*Findings: Collected data revealed that CO<sub>2</sub> levels remained well below the 1,000-ppm benchmark during the sampling period. The air monitoring results indicate that the existing HVAC system is providing adequate fresh air for the conditions under which the monitoring occurred. Because the building was not occupied at the time of this assessment, if concerns persist, consider repeating carbon dioxide monitoring after the building has been re-occupied.*

### 3.2.5 Particulates

Particulate matter (PM) is a complex mixture consisting of varying combinations of dry solid fragments, solid cores with liquid coatings and small droplets of liquid. These tiny particles vary greatly in shape, size and chemical composition, and can be made up of many different materials such as metals, soot, soil and dust.

Cal/OSHA PEL for total particulate matter is 10 milligrams per cubic meter of air (mg/m<sup>3</sup>) and is 5 mg/m<sup>3</sup> for respirable particulates.

California Air Resource Board (ARB) and Environmental Protection Agency (EPA) has set ambient air quality standard (AAQS) for particle matter (PM). Particles are defined by their diameter for air quality regulatory purposes. Those with a diameter of 10 microns or less (PM10) are inhalable into the lungs and can induce adverse health effects. Fine particulate matter is defined as particles that are 2.5 microns or less in diameter (PM2.5). Therefore, PM2.5 comprises a portion of PM10. The following summarizes the ARB and EPA standards by annual and 24-hour averages for PM10 and PM2.5.

	<b>California ARB PM10</b>	<b>EPA Standard PM10</b>
Annual Average	20 µg/m <sup>3</sup>	N/A
24-Hour Average	50 µg/m <sup>3</sup>	150 µg/m <sup>3</sup>
	<b>California ARB PM2.5</b>	<b>EPA Standard PM2.5</b>
Annual Average	12 µg/m <sup>3</sup>	12 µg/m <sup>3</sup>
24-Hour Average	N/A	35 µg/m <sup>3</sup>

*Findings:* Collected data revealed that average PM10 and PM2.5 levels for all monitored locations remained below the 24-hour average standards for PM10 and PM2.5.

### 3.2.6 VOCs

Organic chemicals are widely used as ingredients in household products. Paints, varnishes, and wax all contain organic solvents, as do many cleaning, disinfecting, cosmetic, degreasing, and hobby products. Fuels are made up of organic chemicals. Many of these products can release organic compounds during use and/or storage. There is not a permissible exposure limit for VOCs, in general. Although many of the individual compounds have permissible exposure limits. Ambient air quality standards have not been established for VOCs.

*Findings:* Collected data revealed that VOCs levels remained well below any applicable standard or guideline for the duration of the monitoring period for all locations and were not indicative of a health hazard.

### 3.2.7 Summary of Direct Reading Results

The complete logged data sets from the direct reading instruments are included in Appendix C. The monitoring locations are indicated on the diagram in Appendix A.

A summary of the averages for all the monitored locations, including outdoor readings is below:

**Table 1 – Summary of Direct Reading Measurements by Location**

Location	Monitoring Period	Average						
		CO (ppm)	CO <sub>2</sub> (ppm)	Temp (°F)	Humidity (%)	PM <sub>2.5</sub> (µg/m <sup>3</sup> )	PM <sub>10</sub> (µg/m <sup>3</sup> )	VOCs (ppm)

### 3.3 Air Sampling

During the initial monitoring, air sampling was conducted at sixteen (16) locations with four samples collected from each floor, positioned to represent the HVAC zones. Sampling was performed using diffusive monitoring badges or Sensidyne personal sampling pumps with appropriate sample media, which were calibrated prior to sample collection (pre-calibrated) and at the end of the sampling event with a calibrated rotameter. The flow rate for each sample was established as an average of the two values.

A unique sample identification (ID) number was assigned to each sample and was placed on the sample media. The ID number, flow rate, calibration data, location, and time were also recorded on the sampling data sheet.

Proper transfer of samples from project site to laboratory requires documentation and custody procedures. Components of sample transfer documentation include sample labels, a chain-of-custody record, and a sample analysis request form. All documentation entries were made with waterproof ink. Samples were delivered by Federal Express under proper chain of custody either to SGS Galson, 601 Kirkville Road, East Syracuse, New York or Assay Technologies, 250 DeBartolo Place, #2525, Boardman, OH 44512. SGS Galson and Assay Technologies are accredited by the American Industrial Hygiene Association (AIHA) Industrial Hygiene Proficiency Analytical Testing (IHPAT) programs.

#### 3.3.1 Fiberglass

Fiberglass samples were collected to determine if elevated levels were present, which may indicate a shedding of architectural materials. Fiberglass samples were collected and analyzed following modified NIOSH Method 7400, phase contrast microscopy (“B” counting rules), using 25-mm cellulose ester membrane filters with a conductive cowl.

**Table 2 – Fiberglass Air Sampling Results**

### 3.3.2 Asphalt Fume

Asphalt fume sampling was conducted to measure whether asphalt from recently-installed roofing materials was present in measurable concentrations in the building. Samples were collected and analyzed following modified NIOSH Method 5042, gravimetric, using 37-mm pre-weighted polytetrafluoroethylene (PTFE) filters.

### 3.3.3 Coal Tar Pitch Volatiles (CTPVs)

CTPV sampling was conducted to measure whether asphalt from recently-installed roofing materials was present in measurable concentrations in the building. CTPV samples were collected and analyzed following modified OSHA Method 58 using glass fiber filters. In addition to the PEL, which is cited in the table, the National Institute of Occupational Safety and Health (NIOSH) has established a Recommended Exposure Limit (REL) of 0.1 mg/m<sup>3</sup> for CTPV.

**Table 4 – Coal Tar Pitch Volatiles Air Sampling Results**

### 3.3.4 Stoddard Solvent

Stoddard Solvent sampling was conducted to measure whether Stoddard solvent from recently-installed roofing materials was present in measurable concentrations in the building. Samples were collected and analyzed using Assay Technologies 566 Organic Vapor monitors and modified NIOSH method 1550, gas chromatography.

*Table 5 – Stoddard Solvent Air Sampling Results*

### 3.3.5 Polynuclear Aromatic Hydrocarbons (PNAHs) – 18 Compounds

PNAH sampling was conducted to measure whether PNAH compounds from recently installed roofing materials were present in measurable concentrations in the building. PNAH sampling was conducted using 37-mm PTFE filter with treated amberlite XAD-2 tube and analyzed using modified NIOSH method 5506, high performance liquid chromatography. The samples were analyzed for the following 18 PNAHs compounds:

Acenaphthene, Acenaphthylene, Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(k)fluoranthene, Chrysene, Dibenz(a,h)anthracene, Fluoranthene, Fluorene, Indeno(1,2,3-cd)pyrene, Naphthalene, 1-Methylnaphthalene, 2- Methylnaphthalene, Phenanthrene, and Pyrene,

The Cal/OSHA PEL for several PNAHs are regulated under coal tar pitch volatiles (CTPVs), which is 0.2 mg/m<sup>3</sup>. NIOSH has recommended that workplace exposure limit for PNAHs be set at the lowest detectable concentration, which is 0.1 mg/m<sup>3</sup> for CTPVs. Only the compounds which were detected are shown in the table. The full sample results sets are included in the Appendices.

**Table 6 – PNAH Air Sampling Results Summary**

### 3.3.6 Organic Vapors – 25 Compounds

Volatile organic compounds are widely used as ingredients in household products. Paints, varnishes, and wax all contain organic solvents, as do many cleaning, disinfecting, cosmetic, degreasing, and hobby products. Many of these products can release organic compounds during use and/or storage. There is not a permissible exposure limit for VOCs, in general. Although many of the individual compounds have permissible exposure limits.

VOCs sampling was conducted using Assay Technologies 525 Organic Vapor monitor and analyzed using modified NIOSH method 1550, gas chromatography. The samples were analyzed for the following 25 compounds and compared to the listed Cal/OSHA PEL, Ceiling, and/or STEL, NIOSH REL, and/or American Conference of Governmental Industrial Hygienists (ACGIH) Threshold Limit Values (TLV).

When established, California-OSHA 8-hour PELs are presented. A “STEL” note indicates a short term (15-minute) exposure limit. A “Ceiling” note indicates an instantaneous exposure limit. If a California-OSHA PEL has not been established, a Federal OSHA PEL, Recommended Exposure Limit from the National Institute for Occupational Safety and Health (NIOSH REL) or Threshold Limit Value from the American Conference of Governmental Industrial Hygienists (ACGIH TLV) is presented and noted. “NE” indicates a California-OSHA PEL, Federal-OSHA PEL, NIOSH REL, and ACGIH TLV has not been established.

*Table 7 – Organic Vapor Occupational Exposure Limits*

Name	Exposure Limit or Guideline 8-hour PEL (ppm)	Ceiling and/or STEL (ppm)
1,1,1-Trichloroethane	350 ppm	C-800 ppm, STEL-450 ppm
1-Butanol	50	C-50 ppm
4-Phenylcyclohexene	NE	NE
Acetone	500	C-3,000, STEL-750, NIOSH REL/TLV- 250 ppm,

### 3.3.7 Aldehydes – 10 Compounds

Formaldehyde is a compound that can be found in household products and construction products. Scented air fresheners can contain formaldehyde and other compounds. Glues or adhesives used in pressed wood products, preservatives in paint, and coatings used in fabrics and draperies can all contain aldehydes. Levels of formaldehyde can increase soon after installation of these products, but tend to decline with time, according to the Centers for Disease Control and Prevention and the US Department of Housing and Urban Development “Healthy Housing Reference Manual” (2006).

Aldehydes sampling was conducted using Assay Technologies 571 aldehyde monitor and analyzed using modified OSHA Method 1007, liquid chromatography. The samples were analyzed for the following 10 aldehydes:

Acetaldehyde, benzaldehyde, butyraldehyde, crotonaldehyde, formaldehyde, glutaraldehyde, hexanal, m-tolualdehyde, propionaldehyde, valeraldehyde.

NIOSH recommends that careful consideration should be given to reducing exposure to nine low molecular-weight-aldehydes (including butyraldehyde, crotonaldehyde, glutaraldehyde, propionaldehyde, and valeraldehyde since they are similar mutagenicity to acetaldehyde.

**Table 9 – Aldehyde Air Sampling Results Summary**

Sample Number	Sample Location	Aldehydes (ppm)	PEL <sup>5</sup> (ppm)
PSFA-AH01	Office 212J	None detected	

5 NE indicates no occupational exposure limit is established. Unless otherwise indicated, listed limits are for 8-hour time-weighted averages and from California-OSHA.

### 3.4 Bioaerosol Evaluation

Mold is a normal and essential component of the environment. Everyone is exposed to these biological aerosols, although the effects on an individual's health depend upon the type and amount of airborne mold, and a person's sensitivity. There are no regulations, which establish permissible exposure limits for mold in indoor air. Interpretation of these results is based on the opinions of those who have extensive experience in the analyses of mold. The general guideline for interpreting bioaerosol sampling results is that indoor spore levels should be less than or comparable to outdoor spore levels and be similar in content where outdoor air is the only source.

Aurora collected bioaerosol samples from various indoor areas and outside the buildings. The sampling consisted of using a high-volume air pump, calibrated at 15 liters per minute (lpm), to sample 75 liters of air. Air entering the inlet of the Zefon Air-O-Cell air-sampling cassette passes over a sticky glass slide, which is later analyzed, by an environmental laboratory for mold spores. The Air-O-Cell cassette is a unique sampling device specifically designed for the rapid collection and analysis of airborne aerosols. Collected samples were assigned a unique sample identification number, placed in sealed containers, labeled, and delivered to Environmental Microbiology Laboratory P&K (EMLab) for evaluation using proper chain of custody procedures. EMLab is accredited by the American Industrial Hygiene Association for microbiological analyses. The results are reported in spores per cubic meter of air (spores/m<sup>3</sup>).

Laboratory reports of analysis are included in Appendix B. A summary of the sample locations and total spore results follows. The notes field highlights any total mold spore sample results that indicate a potential indoor mold source and pollen results, when those results exceeded the outdoor air.

28228378	N/A	Outside, west	800	<i>Pollen -110</i>
<b>April 25, 2019 Samples</b>				
PSFA-M01	N/A	Outside, south	1,100	<i>Pollen - 67</i>
PSFA-M02	N/A	Office 141G	53	
PSFA-M03	N/A	Office 127	40	
PSFA-M04	N/A	Roof	530	

**Findings:** The airborne mold spore results revealed inside total mold spore levels were low, with the indoor and outdoor mold types similar in content, indicating no indoor airborne mold amplification in all sampled locations, except for Room 473, which is an unoccupied utility closet on the fourth floor, where the majority of the mold spores identified was *Stachybotrys*. Further investigation was recommended and conducted in Room 473.

**Pollen and other Plant:** Pollen levels were lower than outside for most of the samples, except for in Room 375, 407, and 416 where pollen level was similar or above outside levels.

**Animal and Hyphal Fragments:** The skin cell fragment category often comprises over 50% of the "volume" of identifiable particles in indoor air and are a good combined surrogate indicator of effective fresh air transfer rates, occupant density, commensal bacteria potential, general housekeeping, and filtration of recirculated air in the building. Epithelial cells results below 10,000 are considered low in an indoor environment. The indoor epithelial result was well below 10,000 particles/m<sup>3</sup>.

**Non-Biological:** Elevated levels may be an indication of inadequate housekeeping, ventilation, shedding architectural materials (like fiberglass), and/or higher than desirable personnel occupancy rates. None of the levels seems elevated and no fiberglass was identified.

Follow-up mold sampling was conducted in and around the utility closet (Room 473) on May 15, 2019. Results are summarized as follows:

**Table 12 – Follow-Up Bioaerosol Air Sampling Results Summary**

Sample #	Floor	Location	Total Spores/m <sup>3</sup>	Notes
<i>May 15, 2019 Samples</i>				
PSFA-0515-M01	N/A	Outside, SE	1,800	
PSFA-0515-M02	4	473	840	<i>Less than and similar distribution as outdoors. (utility closet)</i>
PSFA-0515-M03	4	471	710	
PSFA-0515-M04	N/A	Outside, roof	2,400	

Follow-Up Sampling Findings: The airborne mold spore results revealed inside total mold spore levels were low, with the indoor and outdoor mold types similar in content, indicating no indoor airborne mold amplification in all sampled locations.

## 4.0 DISCUSSION, CONCLUSIONS, AND RECOMMENDATIONS

The federal government and the State of California have defined Permissible Exposure Limits (PEL) for chemical exposures in the workplace. These limits refer to “airborne contaminants to which nearly all workers may be exposed daily during a 40-hour workweek for a working lifetime without adverse effect. Because of some variation in individual susceptibility, an occasional worker may suffer discomfort, aggravation of a pre-existing condition, or occupational diseases upon exposures even below the values specified. The exposure limits established by this section reflect current medical opinion and industrial hygiene practice, doubts being resolved on the side of safety, and are intended to be used in accordance with good industrial hygiene practice by qualified persons.<sup>6</sup>” The standard further defines short term exposure limits (STEL) as a 15-minute time-weighted average exposure which is not to be exceeded at any time during a work day even if the 8-hour time-weighted average is below the PEL. A “ceiling limit” is the maximum instantaneous concentration to which an employee may be exposed.

The American Conference of Governmental Industrial Hygienists (ACGIH) and the National Institute of Occupational Safety and Health (NIOSH) have also developed exposure guidelines for workplaces. While these guidelines are not regulatory, every effort should be taken to ensure exposures are below these levels.

The federal government and the State of California (EPA) have also developed ambient air quality standards, which are designed for protection of public health and the environment, including the health of “sensitive” populations such as asthmatics, children, and the elderly.<sup>7</sup>

Where applicable, PELs, NIOSH and ACGIH guidelines, and ambient air quality standards are provided in the discussion of air sampling and direct reading monitoring results.

Air sampling, direct reading air monitoring, and visual observation indicated the following:

- All installed asbestos-containing materials were observed to be in good/intact condition.
- The average temperatures of most areas were within the comfort range, however there were periods where temperatures were colder and hotter than the typical comfort range. **RECOMMENDATION:** Review the HVAC balance for the building to determine if it is feasible to provide occupants with more control over their temperature. While measured temperatures do not indicate a health hazard, maintaining temperatures within the comfort zone can increase overall satisfaction and perception of indoor air quality.
- Humidity was maintained within the comfort range and below the maximum recommended level to minimize growth of allergenic and pathogenic organisms.
- Carbon monoxide was below the permissible exposure limit and ambient air quality standard at all times during the monitoring.

---

<sup>6</sup> Quote from California Code of Regulations 8 CCR 5155.

<sup>7</sup> California ambient air quality standards can be found in 17 CCR 70200, or at <http://www.arb.ca.gov/aqs/aaqs2.pdf>.

- Carbon dioxide was below the benchmark level of 1000 ppm at all times during the monitoring. RECOMMENDATION: Although CO<sub>2</sub> levels were low throughout the monitoring period, the building was unoccupied at the time of the assessment. Since people are a source of indoor CO<sub>2</sub>, and since CO<sub>2</sub> is an indicator of adequate fresh air intake, consider repeating monitoring for CO<sub>2</sub> after the building has been re-occupied.
- Airborne particulates were below the permissible exposure limit and ambient air quality standards.
- The volatile organic compounds (VOCs) measurements remained below any applicable standards and guidelines for the duration of the monitoring period.
- Fiberglass, asphalt, coal tar pitch volatiles, Stoddard solvent, and organic vapors (25 compound scan) were not detected in any of the indoor air samples.
- The majority of polynuclear aromatic hydrocarbons (PNAH) were not detected. Those that were detected were at levels well below the OSHA permissible exposure limit and NIOSH recommended exposure level.
- The majority of aldehyde compounds were not detected. Formaldehyde was initially detected in one location at levels well below the OSHA permissible exposure limit but slightly in excess of the NIOSH recommended exposure level. RECOMMENDATION: Although formaldehyde levels were less than the PEL, it is recommended that fresh air intake and air changes per hour in and around Office 361G be increased to attempt to reduce formaldehyde levels to below the NIOSH recommended exposure level. This can be accomplished by increasing the HVAC fresh air intake, leaving the doors open after hours to allow greater air circulation, using portable fans, and ensuring the HVAC fans servicing the area are left “on”. Additional air sampling for formaldehyde in Office 361G and other third floor areas in the same HVAC zone was conducted. During follow-up sampling, formaldehyde was not detected in 12 of the 13 indoor sample locations and at a level well below the OSHA PEL and slightly in excess of the limit of detection and NIOSH REL in one location. Additional follow-up sampling is scheduled for June 2019.
- Bioaerosol sampling indicated the indoor airborne mold spore levels were very low and similar to type to outdoor air, indicating no indoor airborne mold amplification, in all locations except one unoccupied utility closet, which had mold spore counts that indicated a possible indoor source of airborne mold. SDSU personnel reported that this closet is not connected to the building’s HVAC system. Further investigation was conducted in Room 473 results did not indicate an indoor mold source.

## 5.0 LIMITATIONS

The data and observations collected during this work have been gathered to provide the Client with information pertaining to the areas of the subject property identified in this report. Although Aurora believes that the findings and conclusions provided in this report are reasonable, the assessment is limited to the conditions observed and to the information available at the time of the work. Due to the nature of the work, there is a possibility that conditions may exist which could not be identified within the scope of the assessment or which were not apparent at the time of our site work. The assessment is also limited to information available from the client at the time it was conducted. It is also possible that the testing methods employed at the time of the report may later be superceded by other methods. Aurora does not accept responsibility for changes in the state of the art.

This report is limited to the samples taken and locations sampled. Additional sampling may be needed to further identify other pollutants at the subject property. Microbial growth may occur if sources of moisture are not remediated.

We hope that this information is helpful. Please feel free to contact us at (619) 276-5901 if you have any questions.

**Dear Karen Shockley:**

**Enclosed are the analytical results for the samples received by our laboratory on April 30, 2019.  
All samples on the chain of custody were received in good condition unless otherwise noted.**

**Please contact client services at (888) 432-5227 if you would like any additional information regarding  
this report. Thank you for using SGS Galson.**

**Sincerely,**

**SGS Galson**

**Lisa Swab  
Laboratory Director**

**Enclosure(s)**

**Terms and Conditions & General Disclaimers**

- This document is issued by the Company under its General Conditions of Service accessible at <http://www.sgs.com/en/Terms-and-Conditions.aspx>. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.
- Any holder of this document is advised that information contained herein reflects the Company’s findings at the time of its intervention only and within the limits of Client’s instructions, if any. The Company’s sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

**Analytical Disclaimers**

- Unless otherwise noted within the report, all quality control results associated with the samples were within established control limits or did not impact reported results.
- Note: The findings recorded within this report were drawn from analysis of the sample(s) provided to the laboratory by the Client (or a third party acting at the Client’s direction). The laboratory does not have control over the sampling process, including but not limited to the use of field equipment and collection media, as well as the sampling duration, collection volume or any other collection parameter used by the Client. The findings herein constitute no warranty of the sample’s representativeness of any sampled environment, and strictly relate to the samples as they were presented to the laboratory. For recommended sampling collection parameters, please refer to the Sampling and Analysis Guide at [www.sgs.com](http://www.sgs.com).
- Unrounded results are carried through the calculations that yield the final result and the final result is rounded to the number of significant figures appropriate to the accuracy of the analytical method. Please note that results appearing in the columns preceding the final result column may have been rounded and therefore, if carried through the calculations, may not yield an identical final result to the one reported.
- The stated LOQs for each analyte represent the demonstrated LOQ concentrations prior to correction for desorption efficiency (if applicable).
- Unless otherwise noted within the report, results have not been blank corrected for any field blank or method blank data.

**Accreditations** SGS Galson holds a variety of accreditations and recognitions. Our quality management system conforms with the requirements of ISO/IEC 17025. Where applicable, samples may also be analyzed in accordance with the requirements of ELAP, NELAC, or LELAP under one of the state accrediting bodies listed below. Current Scopes of Accreditation can be viewed at <http://www.sgs.com> in the accreditations section of the "About" page. To determine if the analyte tested falls under our scope of accreditation, please visit our website or call Client Services at (888) 432-5227.

National/International	Accreditation/Recognition	Lab ID#	Program/Sector
AIHA-LAP, LLC - IHLAP, ELLAP, EMLAP	ISO/IEC 17025 and USEPA NLLAP	Lab ID 100324	Industrial Hygiene, Environmental Lead, Environmental Microbiology

State	Accreditation/Recognition	Lab ID#	Program/Sector
New York (NYSDOH)	ELAP and NELAC (TNI)	Lab ID: 11626	Air Analysis, Solid and Hazardous Waste
New Jersey (NJDEP)	NELAC (TNI)	Lab ID: NY024	Air Analysis
Louisiana (LDEQ)	LELAP	Lab ID: 04083	Air Analysis, Solid Chemical Materials
Texas	Texas Dept. of Licensing and Regulation	Lab ID: 1042	Mold Analysis Laboratory license

**Legend**

< - Less than	mg - Milligrams	MDL - Method Detection Limit	ppb - Parts per Billion
> - Greater than	ug - Micrograms	NA - Not Applicable	ppm - Parts per Million
l - Liters	m3 - Cubic Meters	NS - Not Specified	ppbv - ppb Volume
LOQ - Limit of Quantitation	kg - Kilograms	ND - Not Detected	ppmv - ppm Volume
ft2 - Square Feet	cm2 - Square Centimeters	in2 - Square Inches	ng - Nanograms

Date Analyzed: 29-APR-19 - 02-MAY-19

L478031 (Report ID: 1131856):
Results corrected for compound and matrix-specific desorption efficiencies.
SOPs: il-n5506(13)

L478031 (Report ID: 1131856):
Accuracy and mean recovery data presented below is based on a 95% confidence interval (k=2). The estimated accuracy applies to the media, technology, and SOP referenced in this report and does not account for the uncertainty associated with the sampling process. The accuracy is based solely on spike recovery data from internal quality control samples. Where N/A appears below, insufficient data is available to provide statistical accuracy and mean recovery values for the associated analyte.

Table with 3 columns: Parameter, Accuracy, Mean Recovery. Lists various polycyclic aromatic hydrocarbons (PAHs) and their associated accuracy and mean recovery percentages.

Table with 2 columns: Parameter, Method. Lists the same PAHs as the previous table and specifies the analytical method used for each, such as 'mod. NIOSH 5506; HPLC/UV'.

Chrysene	mod. NIOSH 5506; HPLC/UV
Dibenz(a,h)anthracene	mod. NIOSH 5506; HPLC/UV
Fluoranthene	mod. NIOSH 5506; HPLC/UV
Fluorene	mod. NIOSH 5506; HPLC/UV
Indeno(1,2,3-cd)pyrene	mod. NIOSH 5506; HPLC/UV
Naphthalene	mod. NIOSH 5506; HPLC/UV
Phenanthrene	mod. NIOSH 5506; HPLC/UV
Pyrene	mod. NIOSH 5506; HPLC/UV

L478031 (Report ID: 1131833):

SOPs: ia-pcm(29)  
 Samples were analyzed by NIOSH Method 7400 using B counting rules.  
 Per NIOSH 7400, fiber counts less than 100 f/mm<sup>2</sup> or greater than 1300 f/mm<sup>2</sup> have a greater than optimal variability and are probably biased.  
 Fiber count samples will be discarded 60 days from the date of this report.  
 The current intra-laboratory coefficients of variation (CVs) for the applicable fiber ranges are as follows:  
 0.125 (5-20 fibers/100 fields)  
 0.086 (>20-50 fibers/100 fields)  
 0.087 (>50-100 fibers/100 fields)  
 0.082 (>100 fibers/100 fields)  
 The stated CVs apply to the media, technology, and SOP(s) referenced in the report and do not take into account any uncertainty associated with the sampling process.

L478031 (Report ID: 1131841):

SOPs: ic-ctpv(23)

L478031 (Report ID: 1131841):

Accuracy and mean recovery data presented below is based on a 95% confidence interval (k=2). The estimated accuracy applies to the media, technology, and SOP referenced in this report and does not account for the uncertainty associated with the sampling process. The accuracy is based solely on spike recovery data from internal quality control samples. Where N/A appears below, insufficient data is available to provide statistical accuracy and mean recovery values for the associated analyte.

Parameter	Accuracy	Mean Recovery
Coal Tar Pitch Volatiles	+/-17.7%	92.8%

L478031 (Report ID: 1131572):

SOPs: GRAV-SOP-5(21), GRAV-SOP-6(19)  
 Gravimetric analytical accuracy of the sampling media is 0.005 +/- 0.016 mg (average blank weight change +/- 95% confidence interval or k=2). The estimated uncertainty applies to the media, technology, and

Project ID: SDSU-PSFA BLDG  
 PO No.:

Exposure results are the average concentration for the period of time monitored. '<' means the result is 'less than the RptLmt'. RptLmt = Reporting Limit. The results relate only to the items tested. Unless noted below, samples were received in acceptable condition, all applicable quality control were within method specifications, lab blanks were subtracted before a result was reported, and any customer supplied field blanks were not subtracted from sample results. The molar volume at 25 C (24.45 L/mole) was used to calculate parts per million, ppm. Air concentrations reported are based upon field sampling information provided by the customer. For assistance with the content of this report, please visit the Customer Support section of our web site at <http://www.assaytech.com> or contact Technical Support at 1-800-833-1258. For details of significant method modifications go to [www.assaytech.com/method.html](http://www.assaytech.com/method.html).

Additional Work Order Comments: This is a revised report.

Exposure results are the average concentration for the period of time monitored. '<' means the result is 'less than the RptLmt'. RptLmt = Reporting Limit. The results relate only to the items tested. Unless noted below, samples were received in acceptable condition, all applicable quality control were within method specifications, lab blanks were subtracted before a result was reported, and any customer supplied field blanks were not subtracted from sample results. The molar volume at 25 C (24.45 L/mole) was used to calculate parts per million, ppm. Air concentrations reported are based upon field sampling information provided by the customer. For assistance with the content of this report, please visit the Customer Support section of our web site at <http://www.assaytech.com> or contact Technical Support at 1-800-833-1258. For details of significant method modifications go to [www.assaytech.com/method.html](http://www.assaytech.com/method.html).

9666 Businesspark Ave, Suite 102  
San Diego, CA 92131

---

Regarding: Project: SDSU- PSFA Building; Mold Sampling  
EML ID: 2147753

Approved by:

Technical Manager  
Pam Hui

Dates of Analysis:  
Spore trap analysis: 04-29-2019

Service SOPs: Spore trap analysis (EM-MY-S-1038)  
AIHA-LAP, LLC accredited service, Lab ID #160266

---

All samples were received in acceptable condition unless noted in the Report Comments portion in the body of the report. Due to the nature of the analyses performed, field blank correction of results is not applied. The results relate only to the samples as received. Sample air volume is supplied by the client.

EMLab P&K ("the Company") shall have no liability to the client or the client's customer with respect to decisions or recommendations made, actions taken or courses of conduct implemented by either the client or the client's customer as a result of or based upon the Test Results. In no event shall the Company be liable to the client with respect to the Test Results except for the Company's own willful misconduct or gross negligence nor shall the Company be liable for incidental or consequential damages or lost profits or revenues to the fullest extent such liability may be disclaimed by law, even if the Company has been advised of the possibility of such damages, lost profits or lost revenues. In no event shall the Company's liability with respect to the Test Results exceed the amount paid to the Company by the client therefor.

EMLab P&K's LabServe® reporting system includes automated fail-safes to ensure that all AIHA-LAP, LLC quality requirements are met and notifications are added to reports when any quality steps remain pending.

Skin cells (1-4+)	None			1+		
Sample volume (liters)	75			75		
<b>§ TOTAL SPORES/m3</b>			<b>890</b>			<b>410</b>

Comments: A) 16 of the raw count *Cladosporium* spores were present as a single clump.

Spore types listed without a count or data entry were not detected during the course of the analysis for the respective sample, indicating a raw count of <1 spore.

† The spores of *Aspergillus* and *Penicillium* (and others such as *Acremonium*, *Paecilomyces*) are small and round with very few distinguishing characteristics. They cannot be differentiated by non-viable sampling methods. Also, some species with very small spores are easily missed, and may be undercounted.

†† Background debris indicates the amount of non-biological particulate matter present on the trace (dust in the air) and the resulting visibility for the analyst. It is rated from 1+ (low) to 4+ (high). Counts from areas with 4+ background debris should be regarded as minimal counts and may be higher than reported. It is important to account for samples volumes when evaluating dust levels.

The analytical sensitivity is the spores/m<sup>3</sup> divided by the raw count, expressed in spores/m<sup>3</sup>. The limit of detection is the analytical sensitivity (in spores/m<sup>3</sup>) multiplied by the sample volume (in liters) divided by 1000 liters.

For more information regarding analytical sensitivity, please contact QA by calling the laboratory.

‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

§ Total Spores/m<sup>3</sup> has been rounded to two significant figures to reflect analytical precision.

Pollen/m3	< 13			13		
Skin cells (1-4+)	1+			1+		
Sample volume (liters)	75			75		
<b>§ TOTAL SPORES/m3</b>			<b>110</b>			<b>120</b>

**Comments:**

Spore types listed without a count or data entry were not detected during the course of the analysis for the respective sample, indicating a raw count of <1 spore.

† The spores of *Aspergillus* and *Penicillium* (and others such as *Acremonium*, *Paecilomyces*) are small and round with very few distinguishing characteristics. They cannot be differentiated by non-viable sampling methods. Also, some species with very small spores are easily missed, and may be undercounted.

†† Background debris indicates the amount of non-biological particulate matter present on the trace (dust in the air) and the resulting visibility for the analyst. It is rated from 1+ (low) to 4+ (high). Counts from areas with 4+ background debris should be regarded as minimal counts and may be higher than reported. It is important to account for samples volumes when evaluating dust levels.

The analytical sensitivity is the spores/m<sup>3</sup> divided by the raw count, expressed in spores/m<sup>3</sup>. The limit of detection is the analytical sensitivity (in spores/m<sup>3</sup>) multiplied by the sample volume (in liters) divided by 1000 liters.

For more information regarding analytical sensitivity, please contact QA by calling the laboratory.

‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

§ Total Spores/m<sup>3</sup> has been rounded to two significant figures to reflect analytical precision.

Skin cells (1-4+)	< 1+			< 1+		
Sample volume (liters)	75			75		
<b>§ TOTAL SPORES/m3</b>			<b>320</b>			<b>160</b>

**Comments:**

Spore types listed without a count or data entry were not detected during the course of the analysis for the respective sample, indicating a raw count of <1 spore.

† The spores of *Aspergillus* and *Penicillium* (and others such as *Acremonium*, *Paecilomyces*) are small and round with very few distinguishing characteristics. They cannot be differentiated by non-viable sampling methods. Also, some species with very small spores are easily missed, and may be undercounted.

†† Background debris indicates the amount of non-biological particulate matter present on the trace (dust in the air) and the resulting visibility for the analyst. It is rated from 1+ (low) to 4+ (high). Counts from areas with 4+ background debris should be regarded as minimal counts and may be higher than reported. It is important to account for samples volumes when evaluating dust levels.

The analytical sensitivity is the spores/m<sup>3</sup> divided by the raw count, expressed in spores/m<sup>3</sup>. The limit of detection is the analytical sensitivity (in spores/m<sup>3</sup>) multiplied by the sample volume (in liters) divided by 1000 liters.

For more information regarding analytical sensitivity, please contact QA by calling the laboratory.

‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

§ Total Spores/m<sup>3</sup> has been rounded to two significant figures to reflect analytical precision.

Comments: A) 12 of the raw count *Penicillium/Aspergillus* type spores were present as a single clump.

Spore types listed without a count or data entry were not detected during the course of the analysis for the respective sample, indicating a raw count of <1 spore.

† The spores of *Aspergillus* and *Penicillium* (and others such as *Acremonium*, *Paecilomyces*) are small and round with very few distinguishing characteristics. They cannot be differentiated by non-viable sampling methods. Also, some species with very small spores are easily missed, and may be undercounted.

†† Background debris indicates the amount of non-biological particulate matter present on the trace (dust in the air) and the resulting visibility for the analyst. It is rated from 1+ (low) to 4+ (high). Counts from areas with 4+ background debris should be regarded as minimal counts and may be higher than reported. It is important to account for samples volumes when evaluating dust levels.

The analytical sensitivity is the spores/m<sup>3</sup> divided by the raw count, expressed in spores/m<sup>3</sup>. The limit of detection is the analytical sensitivity (in spores/m<sup>3</sup>) multiplied by the sample volume (in liters) divided by 1000 liters.

For more information regarding analytical sensitivity, please contact QA by calling the laboratory.

‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

§ Total Spores/m<sup>3</sup> has been rounded to two significant figures to reflect analytical precision.

Skin cells (1-4+)	1+			< 1+		
Sample volume (liters)	75			75		
<b>§ TOTAL SPORES/m3</b>			<b>710</b>			<b>2,400</b>

Comments: B) 100 of the raw count *Cladosporium* spores were present as a single clump.

Spore types listed without a count or data entry were not detected during the course of the analysis for the respective sample, indicating a raw count of <1 spore.

† The spores of *Aspergillus* and *Penicillium* (and others such as *Acremonium*, *Paecilomyces*) are small and round with very few distinguishing characteristics. They cannot be differentiated by non-viable sampling methods. Also, some species with very small spores are easily missed, and may be undercounted.

†† Background debris indicates the amount of non-biological particulate matter present on the trace (dust in the air) and the resulting visibility for the analyst. It is rated from 1+ (low) to 4+ (high). Counts from areas with 4+ background debris should be regarded as minimal counts and may be higher than reported. It is important to account for samples volumes when evaluating dust levels.

The analytical sensitivity is the spores/m<sup>3</sup> divided by the raw count, expressed in spores/m<sup>3</sup>. The limit of detection is the analytical sensitivity (in spores/m<sup>3</sup>) multiplied by the sample volume (in liters) divided by 1000 liters.

For more information regarding analytical sensitivity, please contact QA by calling the laboratory.

‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

§ Total Spores/m<sup>3</sup> has been rounded to two significant figures to reflect analytical precision.
